SSAI<sup>1</sup>, NASA Langley Research Center<sup>2</sup>

The Fall 2017 CERES Science Team Meeting  
September 26-28, 2017

# Introduction

- What is a reanalysis?
  - A consistent, global best estimate of atmospheric, land and ocean parameters obtained by combining model and observations in a data assimilation system
  - Widely used for various weather and climate studies
- Evaluation of reanalyses using observations:
  - In-situ (e.g. ARM, DYNAMO)
  - Satellite-based (e.g. **CERES EBAF-TOA**)
    - e.g. Wong (2014), Dolinar *et al.* (2016)

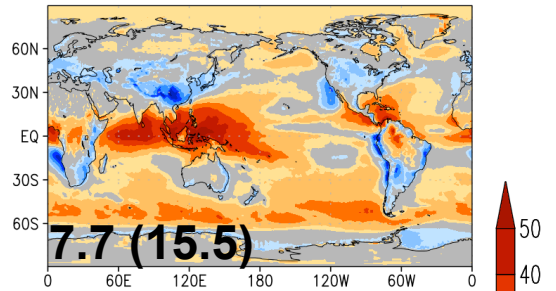

# Data and Methodology

- CERES Ed4.0
  - EBAF-TOA; EBAF-Surface; SSF1deg Lite
- Reanalyses
  - MERRA-2; ERA-Interim; ERA5
- Analysis
  - Period
    - Jan2010-Aug2016
  - Evaluation:
    - Mean climate
    - Year-to-year variation

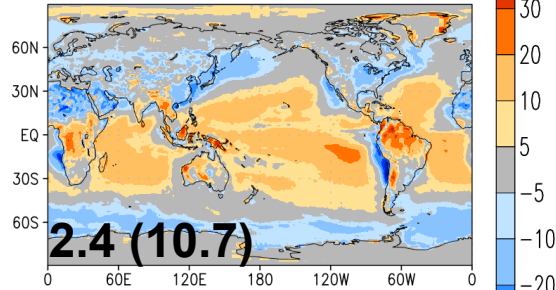

# Mean Climate (2010-2015): TOA

SWall↑

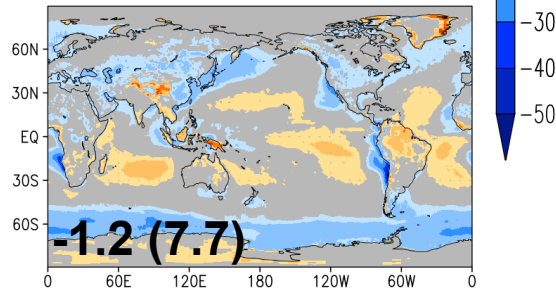

MERRA-2

ERA-I

ERA5

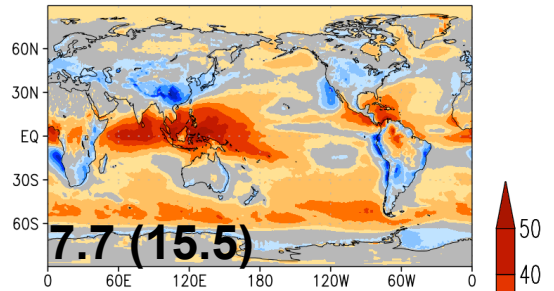

- Diverse performance among the reanalyses;

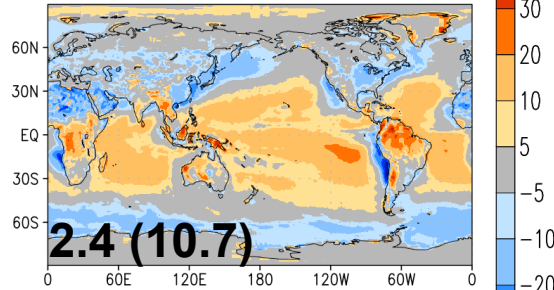

# Mean Climate (2010-2015): TOA

SWall↑

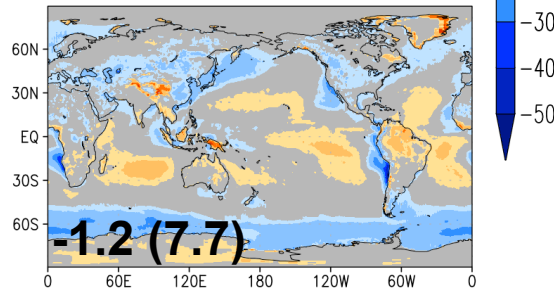

MERRA-2

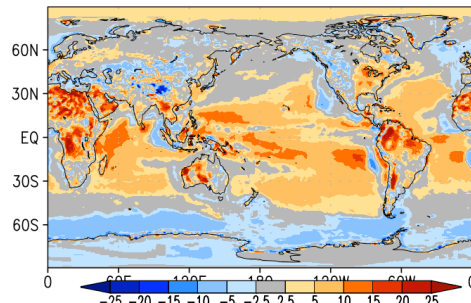

ERA-I

ERA5

ERA-I vs.  
ERA5

- Diverse performance among the reanalyses;
- ERA5 shows considerable improvement over ERA-I in much of the tropics and subtropics.

Closeness:

$|ERA-I - CERES| - |ERA5 - CERES|$

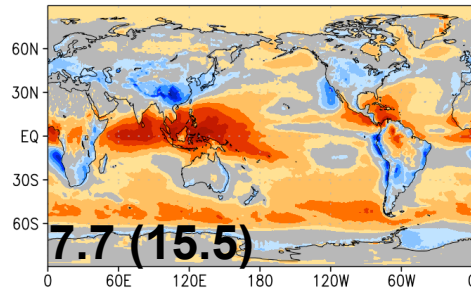

ERA5 closer/better; ERA5 worse

# Mean Climate (2010-2015): TOA

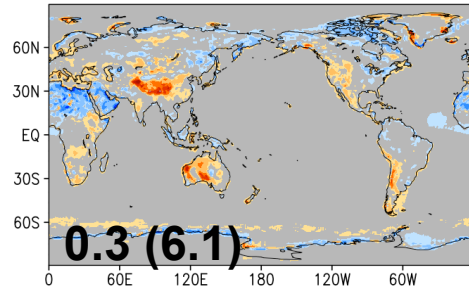

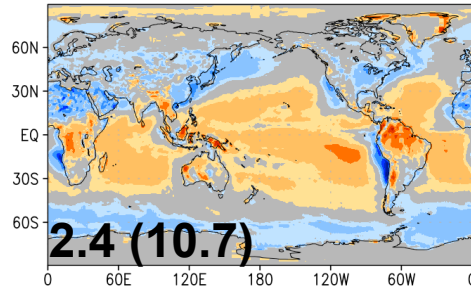

SWall↑

SWclr↑

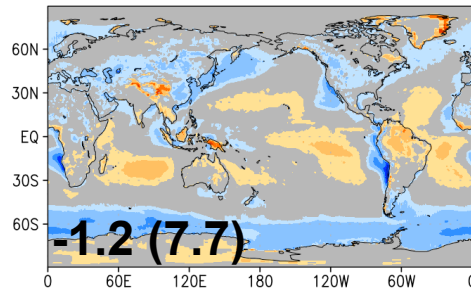

MERRA-2

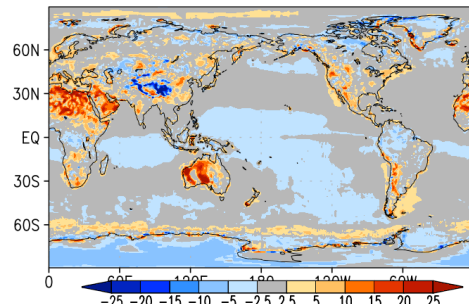

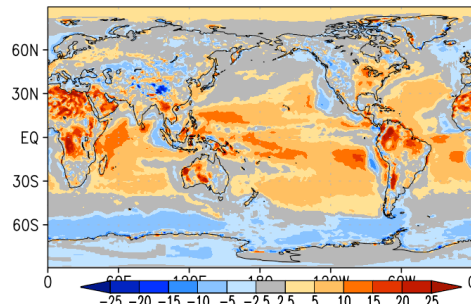

ERA-I

ERA5

ERA-I vs.  
ERA5

ERA5 better; ERA5 worse

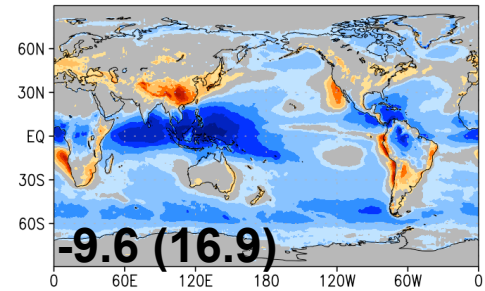

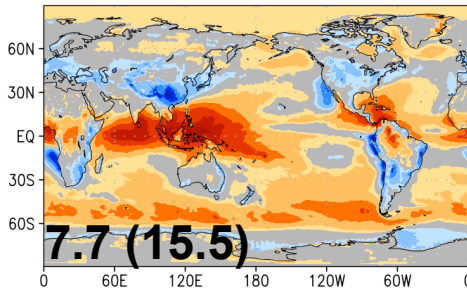

# Mean Climate (2010-2015): TOA

SWall↑

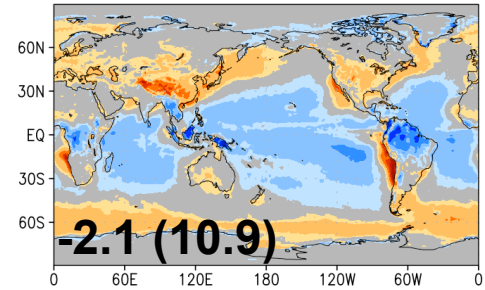

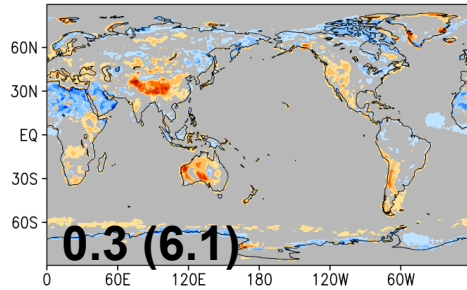

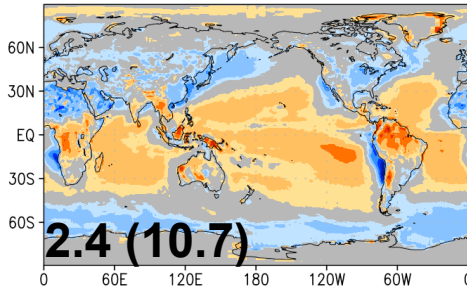

SWclr↑

SW CRE

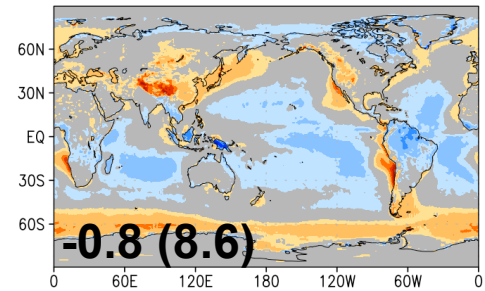

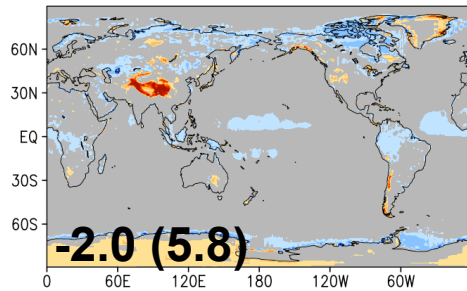

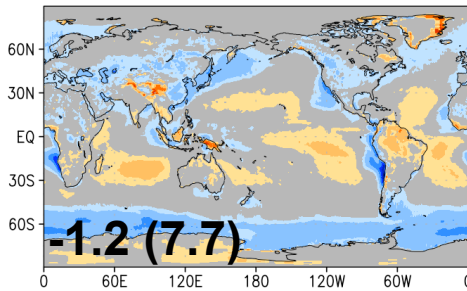

MERRA-2

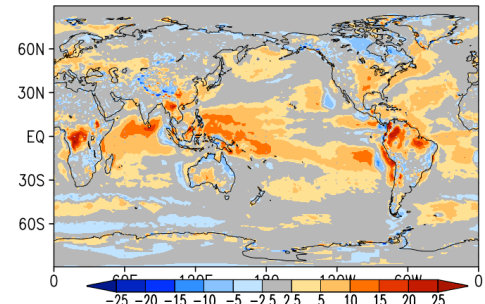

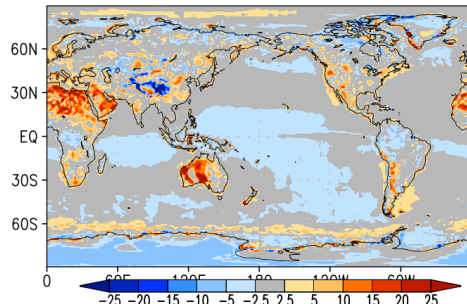

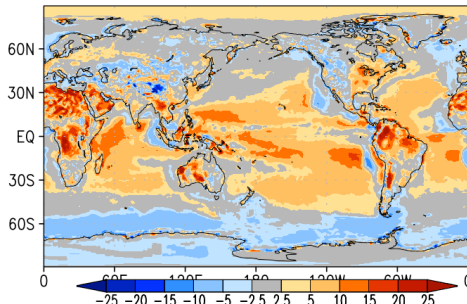

ERA-I

ERA5

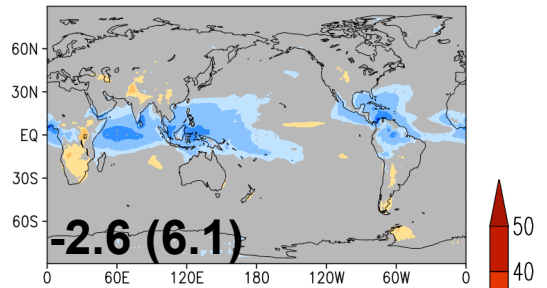

ERA-I vs.  
ERA5

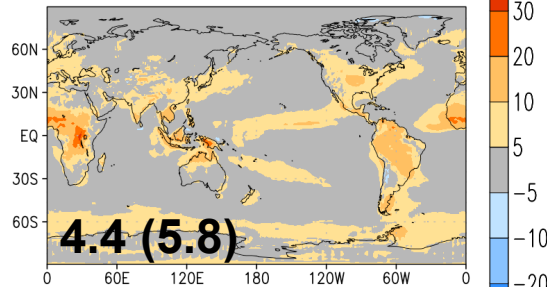

# Mean Climate (2010-2015): TOA

OLRaII

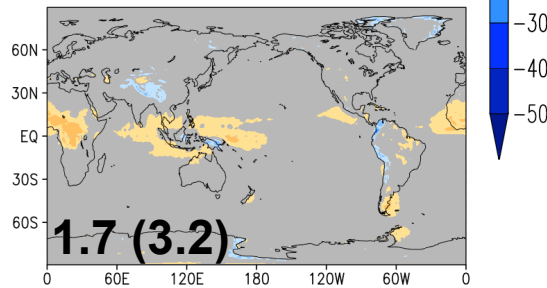

MERRA-2

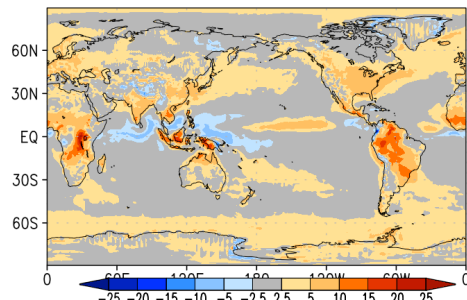

ERA-I

ERA5

ERA-I vs.  
ERA5

- Diverse performance among reanalyses;
- ERA5 shows substantial improvement over ERA-I:
  - ITCZ, SPCZ, land, NH storm track regions

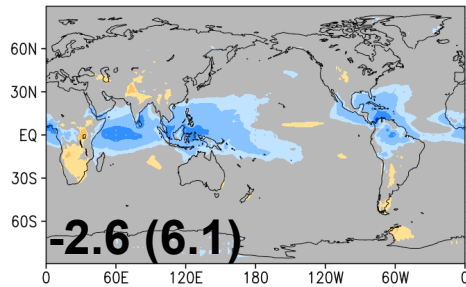

# Mean Climate (2010-2015): TOA

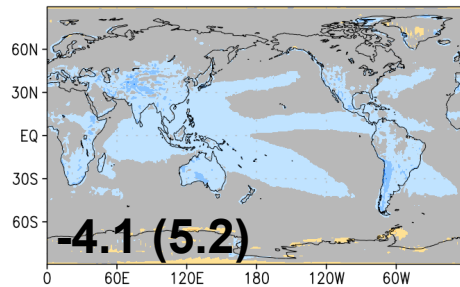

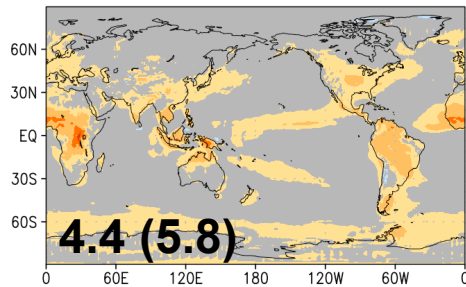

OLRall

OLRclr

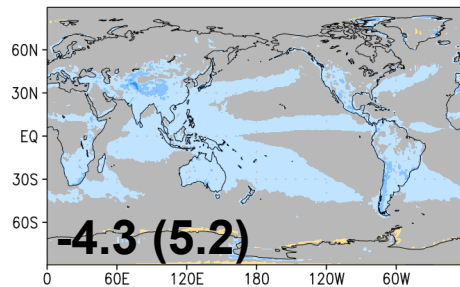

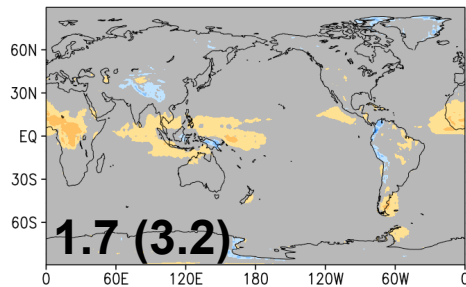

MERRA-2

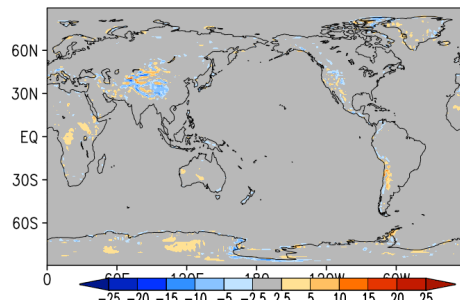

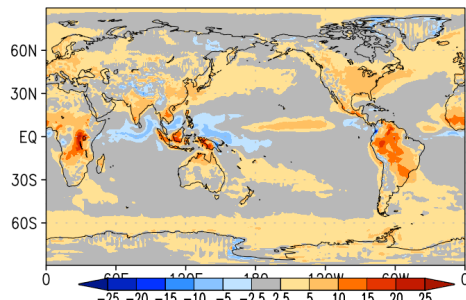

ERA-I

ERA5

ERA-I vs.  
ERA5

- Reanalyses underestimate OLRclr over deep convective regions.

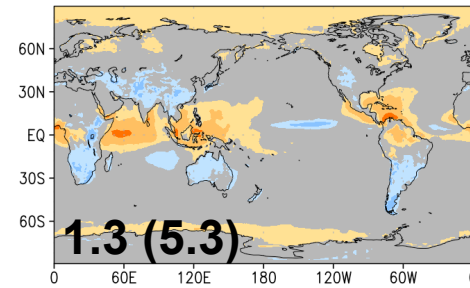

# Mean Climate (2010-2015): TOA

OLRall

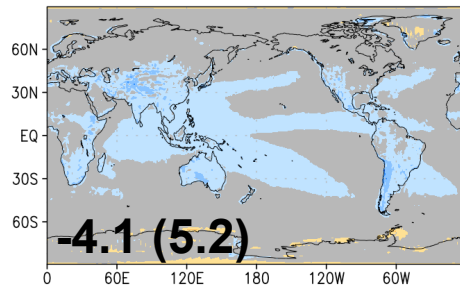

OLRclr

LW CRE

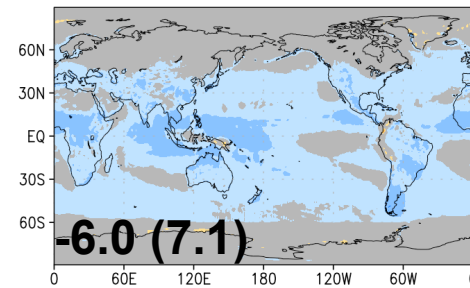

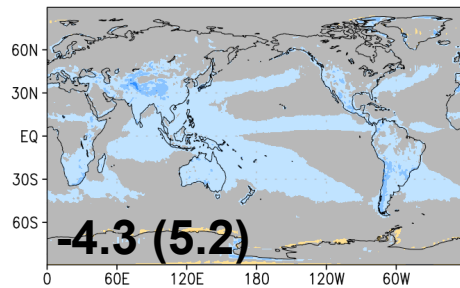

MERRA-2

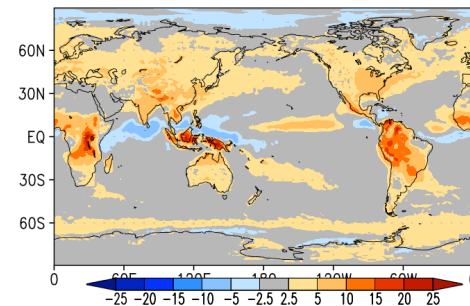

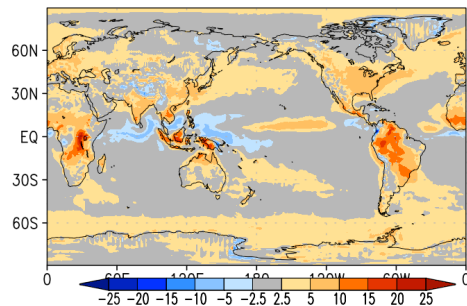

ERA-I

ERA5

ERA-I vs.  
ERA5

# Mean Climate (2010-2015): TOA

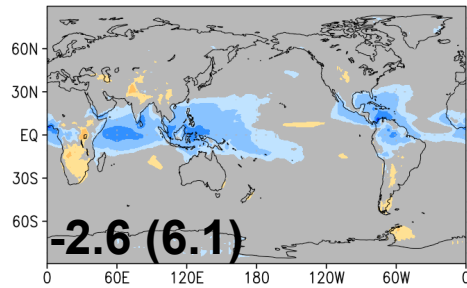

OLRall

OLRclr

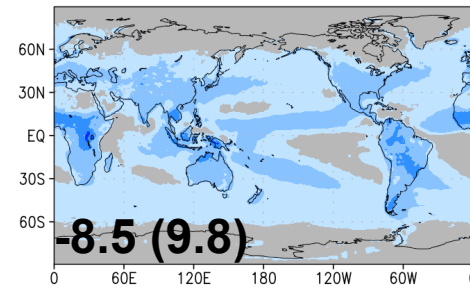

LW CRE

SW CRE  
Net CRE

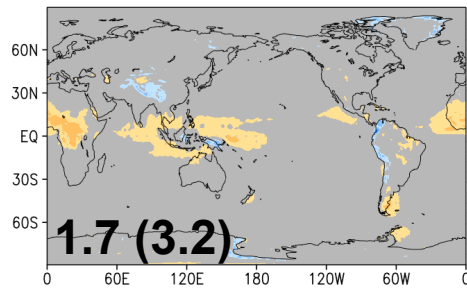

MERRA-2

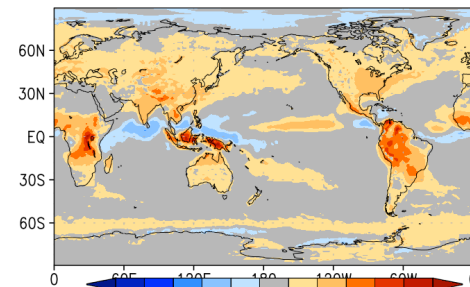

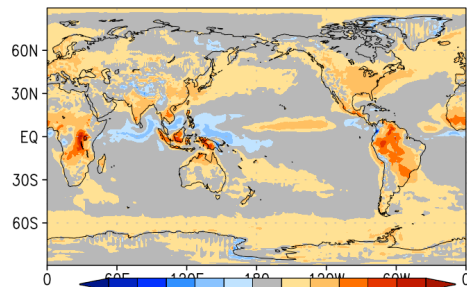

ERA-I

ERA5

ERA-I vs.  
ERA5

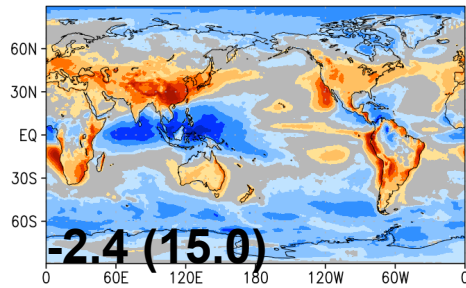

# Mean Climate (2010-2015): Surface

SWall↓

SWall↑

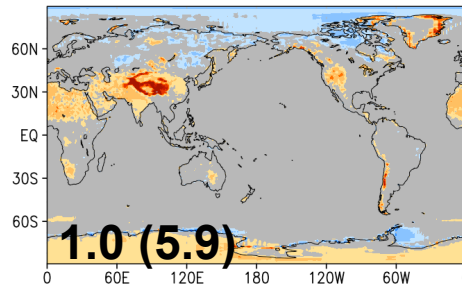

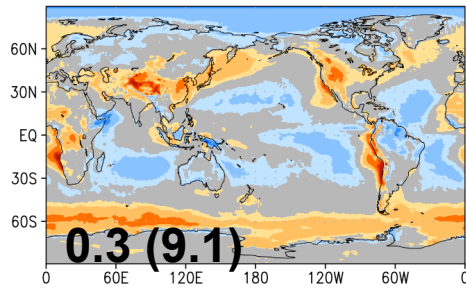

MERRA-2

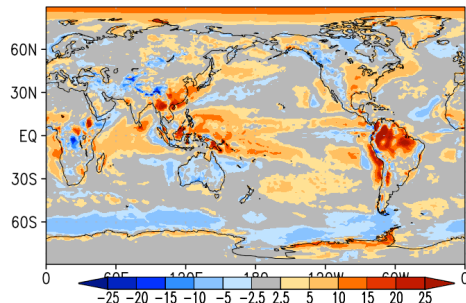

ERA-I

ERA5

ERA-I vs.  
ERA5

- Reanalysis biases in Surface SWall↓ reflect those in TOA SWall↑

# Mean Climate (2010-2015): Surface

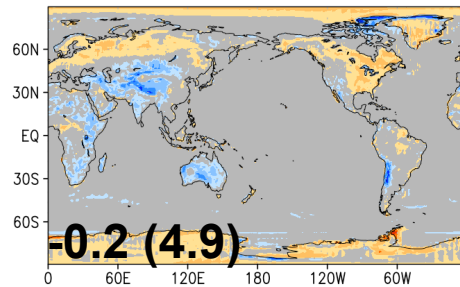

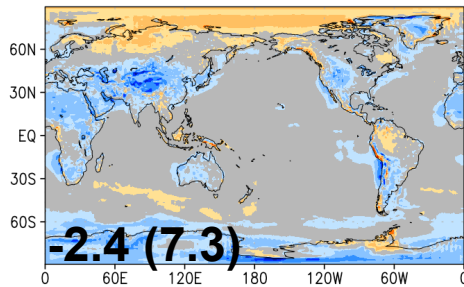

LWall↓

LWall↑

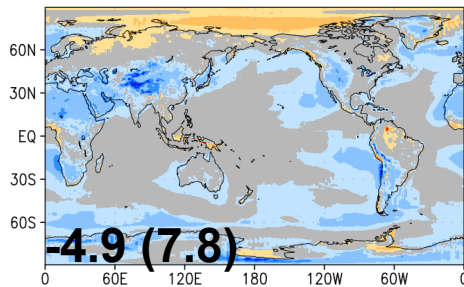

MERRA-2

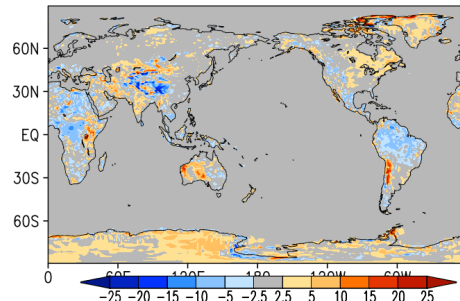

ERA-I

ERA5

ERA-I vs.  
ERA5

- Reanalyses underestimate Surface LWall↓

# Year-to-year Variation

Global Mean of Deseasonalized Anomalies (5Mon RunMean)

TOA  
SWall↑

TOA  
OLRall

ENSO MEI

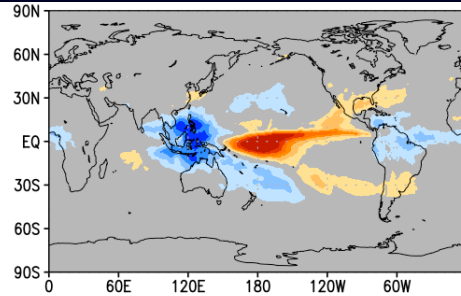

- Better performance in LW than in SW;
- A considerable portion of the interannual variation is contributed by ENSO.

# Year-to-year Variation: ENSO Anomalies

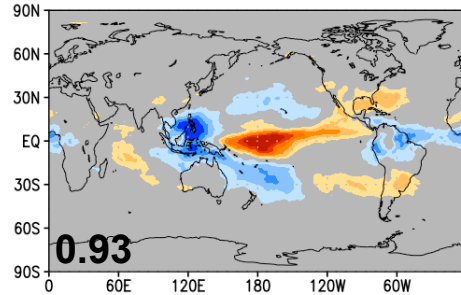

TOA SW CRE

TOA LW CRE

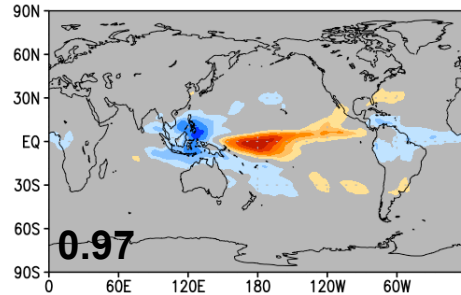

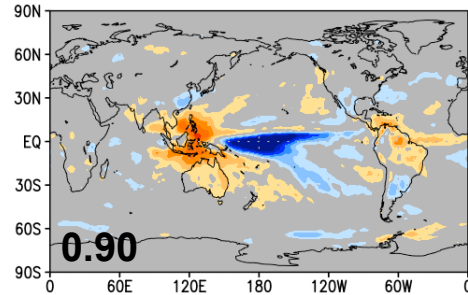

CERES

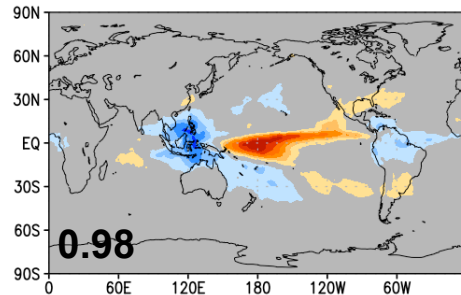

MERRA-2

ERA-I

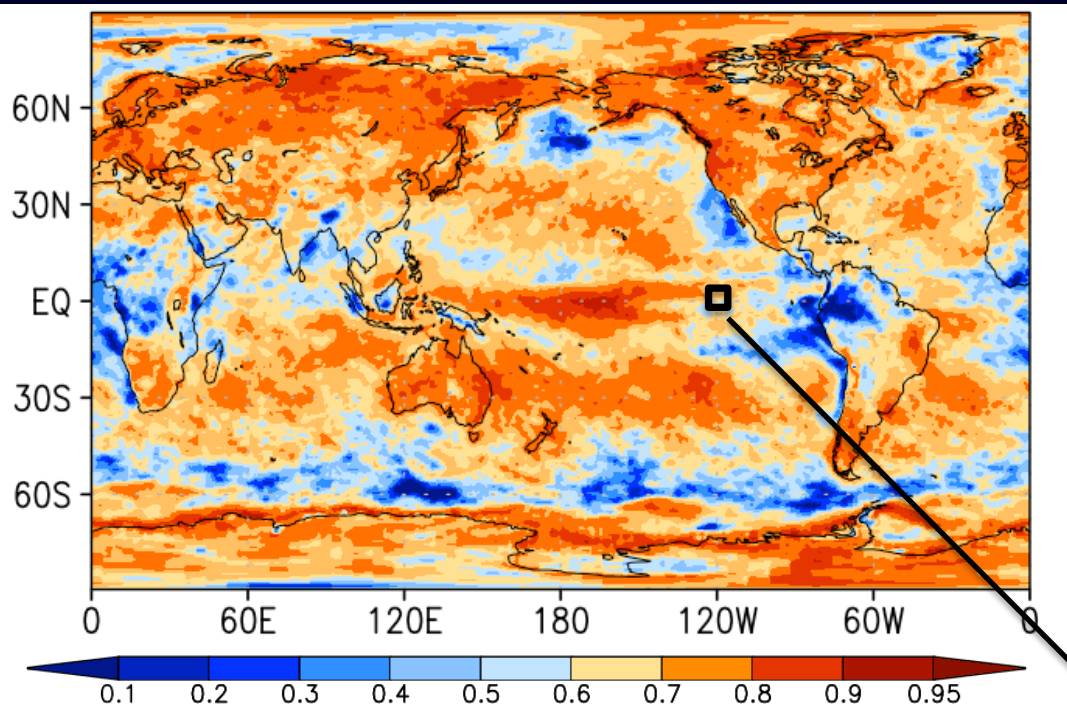

ERA5

Very good agreement

# Year-to-year Variation: Temporal Correlation

TOA SWall↑: tcorr (CERES, MERRA-2)

TOA SWall↑ at 120°W0°N  
tcorr (CERES, MERRA-2): 0.70

# Year-to-year Variation: Temporal Correlation

TOA SWall↑

MERRA-2

ERA-I

ERA5

ERA5  
minus  
ERA-I

- Reanalyses are subject to the performance of their assimilating models, which are challenged in simulating processes over:
  - Tropical land
  - Subtropical stratocumulus regions
  - Extratropical oceans
  - Polar regions
- ERA5 shows considerable improvement over ERA-I in nonpolar regions.

# Year-to-year Variation: Temporal Correlation

TOA SWall↑

Total Cloud Fraction

MERRA-2

ERA-I

ERA5

ERA5  
minus  
ERA-I

Regional biases in TOA SWall↑ are:

- closely associated with those in clouds;
- similarly shown in TOA SW CRE and surface SWall↓, SWall↑, SW CRE.

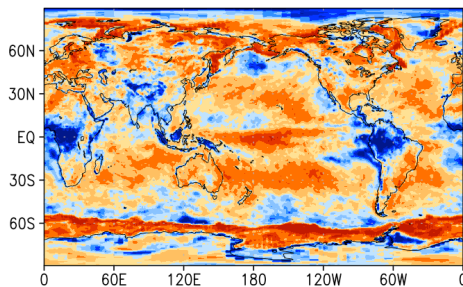

# Year-to-year Variation: Temporal Correlation

TOA SW CRE

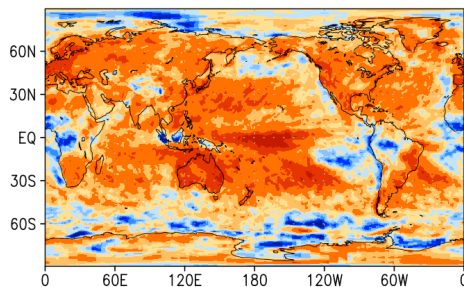

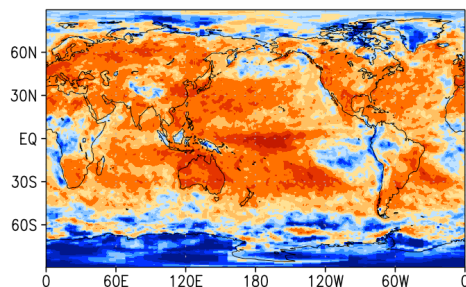

Surface SWall↓

Surface SWall↑

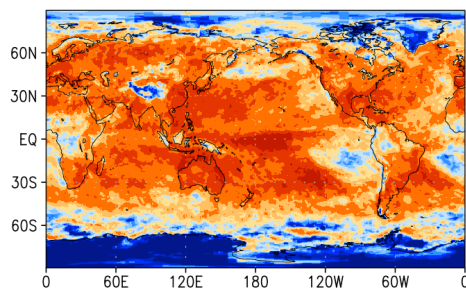

MERRA-2

ERA-I

ERA5

ERA5  
minus  
ERA-I

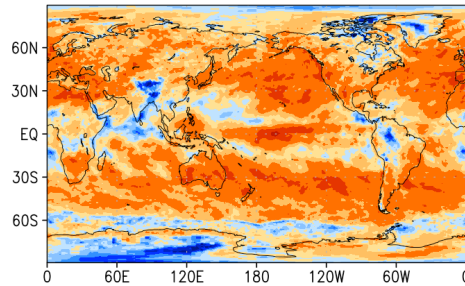

# Year-to-year Variation: Temporal Correlation

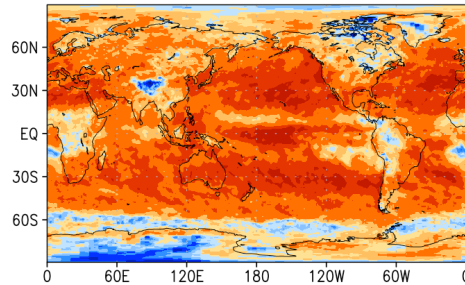

TOA OLR

TOA LW CRE

MERRA-2

ERA-I

ERA5

ERA5  
minus  
ERA-I

- LW better than SW;
- ERA5 is greater than ERA-I;
- Lower corr is seen over tropical deep convective land regions & Tibet.

# Year-to-year Variation: Temporal Correlation

Surface LWall↓

Surface LWall↑

MERRA-2

ERA-I

ERA5

ERA5  
minus  
ERA-I

- LW better than SW;
- ERA5 is greater than ERA-I;
- Lower corr is seen over tropical deep convective land regions & Tibet.

# Year-to-year Variation: Standard Deviation

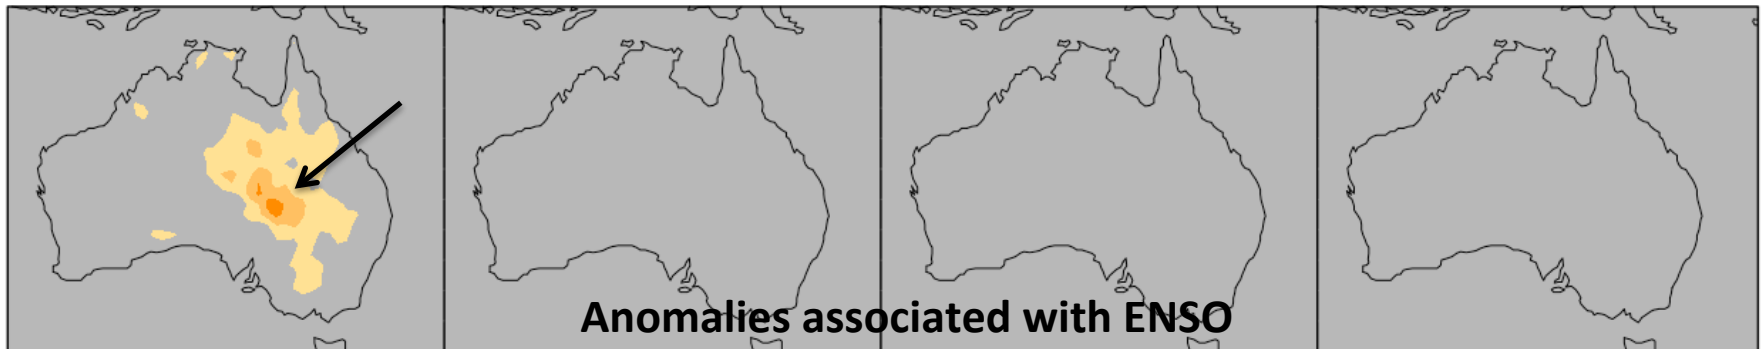

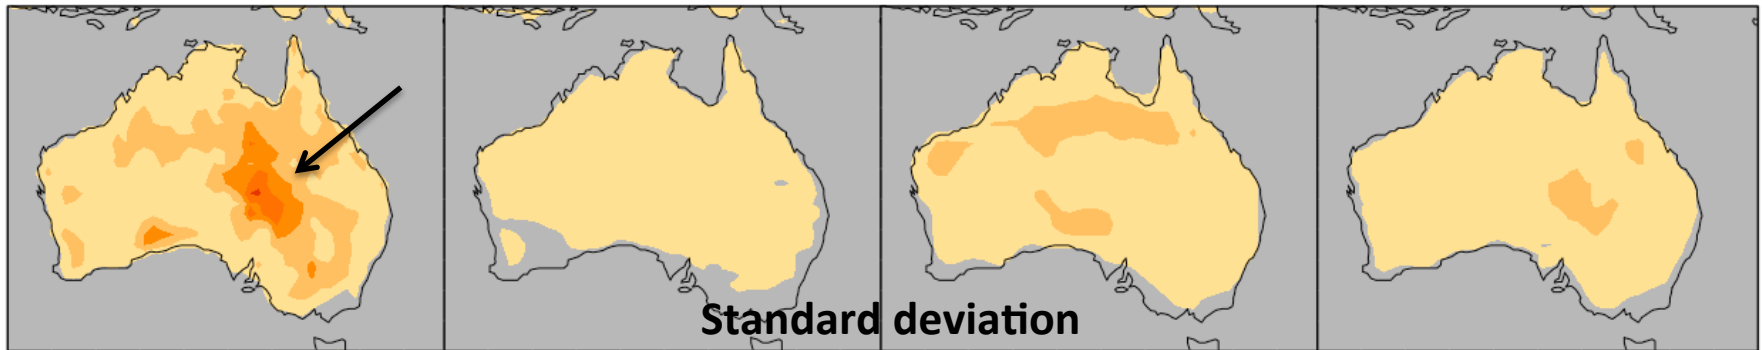

Surface SWall↑

CERES

MERRA-2

ERA-I

ERA-5

- Current reanalyses do not adequately capture observed surface albedo changes (e.g. associated with vegetation changes), as their land albedo is often based on a monthly climatology (Loeb *et al.* 2016).

# Summary

- Current reanalyses:
  - well capture TOA radiative flux variations associated with ENSO as well as those over the NH land area,
  - show greater performance in LW than in SW.
- Current reanalyses are subject to the performance of their assimilating models in simulating cloud and radiative processes. Challenges remain over:
  - tropical deep convective regions, especially tropical land;
  - subtropical stratocumulus regions;
  - extratropical oceans;
  - Land surface albedo.
- ERA5 shows substantial improvement over ERA-Interim.
